Revenue Cycle.

Run the revenue cycle like an instrument.

Agentic operations for regulated healthcare, taken one high-burden workflow at a time, each of them end to end and each one human-gated, before expanding across the spine. Most RCM automation is either brittle rules or opaque AI, and this is neither.

SOLUTION BRIEF · AUGUST 2026

THE GAP IT FILLS

The model proposes. Code decides. A person approves. One architectural signature is applied to every consequential step of the revenue cycle. It is never a rules engine that breaks on the edge case, and never an LLM trusted to commit on its own. Land where it hurts, then expand across the spine.

Land where it hurts. Expand across the spine.

Every stage runs the same loop. Most teams start with charge reconciliation, then expand.

SAME LOOP	▸ COMMON ENTRY	SAME LOOP	SAME LOOP	HUMAN GATE	SAME LOOP
Patient access	**Charge recon**	**Claims & billing**	**Payment posting**	**Denials & appeals**	**A/R & collections**
Referral → order gate. Eligibility, necessity, prior-auth checked before a slot commits.	Every service reconciled to a charge. Leakage caught before it becomes a missing claim.	Clean-claim scrubbing and 837 submission. A person releases the batch.	835 posting and reconciliation. Variances matched and worked, never buried.	Kept human. We surface root cause and draft; judgment stays with your team.	Prioritized follow-up and balance actions, approved before they reach a patient.

↻ DENIAL SIGNAL Every denial feeds back as diagnostic data, **tightening the front-end gate, charge recon, and coding hand-off over time.** The spine doesn't just protect revenue once, it gets more accurate the longer it runs.

/ propose

The model proposes

AI — GENERATIVE

A model drafts the action, whether that is the order to create, the claim to file or the follow-up to run. Fast and flexible, but never trusted blindly.

POWERED BY **Azure AI**

/ verify

The verifier decides

CODE — DETERMINISTIC

A deterministic engine checks the proposal against hard constraints such as eligibility, necessity, credentialing and contract terms. It works as a compiler for the revenue cycle.

POWERED BY **Dataverse · Power Automate**

/ approve

The person approves

HUMAN — ACCOUNTABLE

A person reviews the verified diff and approves before anything commits. Full audit trail; nothing consequential happens unnamed.

POWERED BY **Power Apps · Copilot**

HOW IT SITS IN YOUR ESTATE

Your EMR and claims systems stay the system of record. We integrate; we never duplicate.

One agentic solution, on Azure, over the platform the customer already owns. The spine reads from and writes back to the systems that already hold the data, whether that is the EMR, the claims system or scheduling, so nothing is copied into a second record and there is nothing to reconcile later. There is no new system to procure and no rip-and-replace, and it gets more accurate the longer it runs.
